Or Zilberberg

Digital Game Design M.A. | Shenkar

Wireframes | Design Inspirations | Thought Process

1. Thought Process

Core Vision

The goal was to create a portfolio that reflects my identity at the intersection of engineering and game design. Rather than a traditional, text-heavy CV-style site, I wanted the portfolio to feel like an interactive experience - clean, bold, and with subtle game-like touches that hint at my background in digital game design.

Design Decisions

Minimalist card-based layout: Each page is centered around a single prominent card with a unique gradient. This creates visual consistency while giving each section its own personality - purple for the landing page, green for About Me, orange for Projects, and blue for Contact.

Typography-driven identity: I chose Blacker Sans Pro (Extrabold) as the sole display typeface. Its heavy weight and strong character create an immediate visual identity without relying on complex graphics. The uppercase treatment in navigation and labels reinforces a confident, modern tone.

Interaction as storytelling: As a game design student, I believe every interaction should feel intentional. The particle network on the landing page reacts to mouse movement, creating a sense of life. The 3D tilt effect on project cards invites exploration. The uniform page transitions give a smooth, polished feel when navigating between sections.

Technical Approach

I deliberately chose vanilla HTML, CSS, and JavaScript - no frameworks, no build tools. This decision was driven by two principles: first, to demonstrate that strong design and interactivity don't require heavy tooling; second, to keep the codebase transparent and easy to understand. Shared scripts (nav.js for consistent navigation, page-transition.js for uniform entrance animations) keep the code DRY across all seven pages.

Content Strategy

The Home page serves as a bold first impression - name, title, photo, nothing more. The About Me page tells my story: the journey from Industrial Engineering at Ben-Gurion to game design at Shenkar. The Projects page showcases three works that span my interests: Unity Voice (a voice-controlled product recognized by Microsoft), Easy Peasy Lemon Squeezy (a fast-paced arcade game built in Unity), and Rhythm Revenge (a sound-design-focused rhythm game). Each project page follows the same structure - badge, title, sections for overview, concept, and tech, plus a call-to-action - ensuring visitors can quickly understand each work.

2. Wireframes

Below are the initial wireframe sketches for the main site pages. Each page follows the same structural pattern: top bar, a gradient content card, and a shared footer navigation.

3. Design Inspirations

Apple Product Pages

The card-based layout and generous whitespace are inspired by Apple's product pages. Their approach of letting a single visual element breathe within a clean container informed the hero card design on the landing page.

Brutalist Typography Trends

The bold, oversized headings (like the 80px 'Projects' title) draw from the brutalist web design movement. The contrast between heavy display type and minimal body text creates visual hierarchy without relying on decorative elements.

Game UI / HUD Design

The interactive elements - particle systems, 3D card tilt, smooth transitions - are inspired by modern game UI. Games like Monument Valley and Alto's Odyssey demonstrate how subtle motion and feedback can make minimal interfaces feel alive and engaging.

Gradient & Color Palette

Each page has a signature gradient that sets its mood: soft purple (creative/personal), warm green (approachable/bio), vibrant orange (energetic/projects), and cool blue (professional/contact). This palette approach was inspired by Spotify's use of color to create emotional associations with different content areas.
